(54) Title: NUCLEIC ACIDS FOR DETECTING ASPERGILLUS SPECIES AND OTHER FILAMENTOUS FUNGI

(57) Abstract

3

Nucleic acids for detecting Aspergillus species and other filamentous fungi are provided. Unique internal transcribed spacer 2 coding regions permit the development of nucleic acid probes specific for five different species of Aspergillus, three species of Fusarium, four species of Mucor, two species of Penecillium, five species of Rhizopus, one species of Rhizomucor, as well as probes for Absidia corymbifera, Cunninghamella elagans, Pseudallescheria boydii, and Sporothrix schenkii. The invention thereby provides methods for the species-specific detection and diagnosis of infection by Aspergillus, Fusarium, Mucor, Penecillium, Rhizopus, Rhizomucor, Absidia, Cunninghamella, Pseudallescheria or Sporthrix in a subject. Furthermore, genus-specific probes are also provided for Aspergillus, Fusarium and Mucor, in addition to an all-fungus nucleic acid probe.

NUCLEIC ACIDS FOR DETECTING ASPERGILLUS SPECIES AND OTHER FILAMENTOUS FUNGI

This invention was made in the Centers for Disease Control Mycotic Diseases Laboratories, an agency of the United States Government.

Technical Field

This application relates in general to the field of diagnostic microbiology. In particular, the invention relates to the species-specific detection of Aspergillus, Fusarium, Mucor, Penicillium, Rhizopus, Rhizomucor, Absidia, Cunninghamella, Pseudallescheria boydii (Scedosporium apiospermum), and Sporothrix species.

Background of the Invention

In recent years, chemotherapy for hematological malignancies, and high-dose corticosteroid treatment for organ transplant recipients, along with the spread of AIDS, have greatly increased the number of immunocompromised patients (1, 12, 14, 43). Saprophytic filamentous fungi, such as Aspergillus, Rhizopus, and Mucor species, found in the environment and considered to be of low virulence, are now responsible for an increasing number of infections in the immunocompromised host (17, 20, 43). In addition, these infections are often fulminant and rapidly fatal in immunocompromised patients (7, 11, 12, 20, 44). Morbidity and mortality is extremely high; for example, aspergillosis has a mortality rate of approximately 90% (8, 11).

To complicate matters, diagnosis is difficult and symptoms are often non-specific (18, 27, 29, 42, 44). Antibody-based tests can be

ن.

5

10

15

20

25

30

35

ŧ,

أبيب

unreliable due to the depressed or variable immune responses of immunocompromised patents (2, 9, 18, 46). Antigen detection tests developed to date have fallen short of the desired sensitivity (2, 9, 38). Radiographic evidence can be non-specific and inconclusive (5, 29, 36), although some progress in diagnosis has been made with the advent of computerized tomography (40). However, definitive diagnosis still requires either a positive blood or tissue culture or histopathological confirmation (3, 21). An added complication is that the invasive procedures necessary to obtain biopsy materials are often not recommended in thrombocytopenic patient populations (37, 41).

Even when cultures of blood, lung or rhinocerebral tissues are positive, morphological and biochemical identification of filamentous fungi can require several days for adequate growth and sporulation to occur, delaying targeted drug therapy. Some atypical isolates may never sporulate, making identification even more difficult (23). When histopathology is performed on tissue biopsy sections, the morphological similarities of the various filamentous fungi in tissue make differentiation difficult (16). Fluorescent antibody staining of histopathological tissue sections is not specific unless cross-reactive epitopes are absorbed out which can make the resultant antibody reactions weak (14, 19). Therapeutic choices vary (7, 41, 44) making a test to rapidly and specifically identify filamentous fungi urgently needed for the implementation of appropriately targeted therapy. Early and accurate diagnosis and treatment can decrease morbidity and increase the chances for patient survival (6, 27, 39). identification of filamentous fungi to at least the species level would be epidemiologically useful (24, 31, 43, 47).

PCR-based methods of detection, which show promise as rapid, sensitive means to diagnose infections, have been used in the identification of DNA from *Candida* species (13, 15, 30) and some other fungi, particularly *Aspergillus* species (31, 33, 45). However, most of these tests are only genus-specific (28, 38) or are directed to detect only single-copy genes (4, 35). Others have designed probes to detect multi-copy genes so as to increase test sensitivity (31, 33) but in doing so have lost test specificity because they have used highly conserved genes, which detect one or a few species but which are also plagued with cross-reactivities to human, fungal or even viral DNA (25, 31, 33).

Therefore, it is an object of the invention to provide improved materials and methods for detecting and differentiating Aspergillus and other filamentous fungal species in the clinical and laboratory settings.

Summary of the Invention

The present invention relates to nucleic acids for detecting Aspergillus, Fusarium, Mucor, Penicillium, Rhizopus, Rhizomucor, Absidia, Cunninghamella, Pseudallescheria (Scedosporium), and Sporothrix species. Unique internal transcribed spacer 2 coding regions permit the development of probes specific for five different Aspergillus species, A. flavus, A. fumigatus, A. niger, A. terreus, and A. nidulans. The invention thereby provides methods for the species-specific detection and diagnosis of Aspergillus infection in a subject. In addition, species probes have been developed for three Fusarium, four Mucor, two Penicillium, five Rhizopus and one Rhizomucor species, as well as probes for Absidia corymbifera, Cunninghamella elegans, Pseudallescheria boydii (Scedosporium apiospermum), and Sporothrix schenckii. Generic probes for Aspergillus, Fusarium, and Mucor species have also been developed.

20

These and other objects, features and advantages of the present invention will become apparent after a review of the following detailed description of the disclosed embodiments and the appended claims.

Detailed Description of the Invention

25

This invention provides a simple, rapid, and useful method for differentiating filamentous fungal species from each other and from other medically important fungi. This invention enables a rapid, simple and useful method to isolate fungal DNA from host samples, and to apply the species- and genus-specific probes for the diagnosis of a disease. Ultimately, these probes can be used for *in situ* hybridization or *in situ* PCR diagnostics so that the morphology of host tissue, and microorganisms, remain intact.

30

The invention provides nucleic acids containing regions of specificity for five Aspergillus, three Fusarium, four Mucor, two Penicillium, five Rhizopus and one Rhizomucor species as well as probes for Absidia corymbifera, Cunninghamella elegans, Pseudallescheria boydii (Scedosporium apiospremum), and Sporothrix schenckii. These nucleic acids are from the internal transcribed spacer 2 ("ITS2") region of ribosomal deoxyribonucleic

35

4

1.33

...

5

10

15

20

25

30

35

acid (rDNA) of the genome of the aforementioned filamentous fungi. The ITS2 region is located between the 5.8S rDNA region and the 28S rDNA region.

In particular, the invention provides nucleic acids from Aspergillus flavus (SEQ ID NO:1), Aspergillus fumigatus (SEQ ID NO:2), Aspergillus niger (SEQ ID NO:3), Aspergillus terreus (SEQ ID NO:4), Aspergillus nidulans (SEQ ID NO:5), Fusarium solani (SEQ ID NO:6), Fusarium moniliforme (SEQ ID NO:7), Mucor rouxii (SEQ ID NO:8), Mucor racemosus (SEQ ID NO:9), Mucor plumbeus (SEQ ID NO:10), Mucor indicus (SEQ ID NO:11), Mucor circinilloides f. circinelloides (SEQ ID NO:12), Rhizopus oryzae (SEQ ID NO:13 and NO:14), Rhizopus microsporus (SEQ ID NO:15 and 16), Rhizopus circinans (SEQ ID NO:17 and 18), Rhizopus stolonifer (SEQ ID NO: 19), Rhizomucor pusillus (SEQ ID NO:20), Absidia corymbifera (SEQ ID NO:21 and 22), Cunninghamella elegans (SEQ ID NO:23), Pseudallescheria boydii (teleomorph of Scedosporium apiospermum) (SEQ ID NO:24, 25, 26, and 27), Penicillium notatum (SEQ ID NO:28), and Sporothrix schenkii (SEQ ID NO:29). These sequences can be used to identify and distinguish the respective species of Aspergillus, Fusarium, Mucor, Rhizopus, and Penicillium, and identify and distinguish these species from each other and from Absidia corymbifera, Cunninghamella elegans, Pseudallescheria boydii(Scedosporium apiospermum), and Sporothrix schenkii.

Furthermore, the invention provides isolated nucleic acid probes derived from GenBank nucleic acid sequences (for Penicillium marneffei and Fusarium oxysporum only) or from the above nucleic acid sequences which may be used as species-specific identifiers of Aspergillus flavus (SEQ ID NO:30 and 31), Aspergillus fumigatus (SEQ ID NO:32), Aspergillus niger (SEQ ID NO:33), Aspergillus terreus (SEQ ID NO:34), Aspergillus nidulans (SEQ ID NO:35), Mucor rouxii (SEQ ID NO:36), Mucor plumbeus (SEQ ID NO:37), Mucor indicus (SEQ ID NO:38), Mucor circinilloides f. circinelloides (SEQ ID NO:39), Mucor racemosus (SEQ ID NO:40), Rhizopus oryzae (SEQ ID NO:41), Rhizopus circinans (SEQ ID NO:42), Rhizomucor pusillus (SEQ ID NO:43), Rhizopus stolonifer (SEQ ID NO:44), Pseudallescheria boydii (Scedosporium apiospermum)(SEQ ID NO:45), Penicillium notatum (SEQ ID NO:46), Penicillium marneffei (SEQ ID NO:47 and 48), Fusarium moniliforme (SEQ ID NO:49), Fusarium oxysporum (SEQ ID NO:50), Fusarium solani (SEQ ID NO:51),

rei

Cunninghamella elegans (SEQ ID NO: 52, 53, and 54), Absidia corymbifera (SEQ ID NO:55), Sporothrix schenkii (SEQ ID NO:56), and Rhizopus microsporus (SEQ ID NO:57). Such probes can be used to selectively hybridize with samples containing nucleic acids from species of Aspergillus, Fusarium, Mucor, Rhizopus (or Rhizomucor), Penicillium, or from Absidia corymbifera, Cunninghamella elegans, Pseudallescheria boydii (Scedosporium apiospermum), and Sporothrix schenkii. These fungi can be detected after polymerase chain reaction or ligase chain reaction amplification of fungal DNA and specific probing of amplified DNA with DNA probes labeled with digoxigenin, reacted with anti-digoxigenin antibodies labeled with horseradish peroxidase and a colorimetric substrate, for example. Additional probes can routinely be derived from the sequences given in SEQ ID NOs:1-29, which are specific for the respective species. Therefore, the probes shown in SEQ ID NOs:30-57 are only provided as examples of the species-specific probes that can be derived from SEQ ID NOs:1-29.

Generic probes for Aspergillus (SEQ ID NO:58), Fusarium, (SEQ ID NO:59) and Mucor (SEQ ID NO:60) species have also been developed to identify all members of their respective species which are listed above as well as an all-fungus biotinylated probe (SEQ ID NO:61) to capture all species-specific and generic probes listed above for their detection.

By "isolated" is meant nucleic acid free from at least some of the components with which it naturally occurs. By "selective" or "selectively" is meant a sequence which does not hybridize with other nucleic acids to prevent adequate determination of an Aspergillus, Fusarium, Mucor, Penicillium, Rhizopus or Rhizomucor genus or species or of Absidia corymbifera, Cunninghamella elegans, Pseudallescheria boydii (Scedosporium apiospermum), or Sporothrix schenckii species.

The hybridizing nucleic acid should have at least 70% complementarity with the segment of the nucleic acid to which it hybridizes. As used herein to describe nucleic acids, the term "selectively hybridizes" excludes the occasional randomly hybridizing nucleic acids and thus has the same meaning as "specifically hybridizing". The selectively hybridizing nucleic acids of the invention can have at least 70%, 80%, 85%, 90%, 95%, 97%, 98%, and 99% complementarity with the segment of the sequence to which it hybridizes.

The invention contemplates sequences, probes and primers which selectively hybridize to the complementary, or opposite, strand of DNA

Ġ,

A STATE OF

94

5

10

15

20

25

30

35

×

1

13

as those specifically provided herein. Specific hybridization with nucleic acid can occur with minor modifications or substitutions in the nucleic acid, so long as functional species-specific or genus-specific hybridization capability is maintained. By "probe" is meant nucleic acid sequences that can be used as probes or primers for selective hybridization with complementary nucleic acid sequences for their detection or amplification, which probes can vary in length from about 5 to 100 nucleotides, or preferably from about 10 to 50 nucleotides, or most preferably about 18 nucleotides. The invention provides isolated nucleic acids that selectively hybridize with the species-specific nucleic acids under stringent conditions and should have at least 5 nucleotides complementary to the sequence of interest. See generally, Maniatis (26).

If used as primers, the invention provides compositions including at least two nucleic acids which hybridize with different regions so as to amplify a desired region. Depending on the length of the probe or primer, target region can range between 70% complementary bases and full complementarity and still hybridize under stringent conditions. For example, for the purpose of diagnosing the presence of the Aspergillus, the degree of complementarity between the hybridizing nucleic acid (probe or primer) and the sequence to which it hybridizes (e.g., Aspergillus DNA from a sample) is at least enough to distinguish hybridization with a nucleic acid from other yeasts and filamentous fungi. The invention provides examples of nucleic acids unique to each filamentous fungus in the listed sequences so that the degree of complementarity required to distinguish selectively hybridizing from nonselectively hybridizing nucleic acids under stringent conditions can be clearly determined for each nucleic acid.

Alternatively, the nucleic acid probes can be designed to have homology with nucleotide sequences present in more than one species of the fungi listed above. Such a nucleic acid probe can be used to selectively identify a group of species such as the generic probes listed for Aspergillus (SEQ ID NO:58), Fusarium (SEQ ID NO:59), and Mucor (SEQ ID NO:60) as well as all fungi listed (SEQ ID NO:61). Additionally, the invention provides that the nucleic acids can be used to differentiate the filamentous fungi listed in general from other filamentous fungi and yeasts, such as Candida species. Such a determination is clinically significant, since therapies for these infections differ.

The invention further provides methods of using the nucleic acids to detect and identify the presence of the filamentous fungi listed, or

THE REAL PROPERTY.

ij

5

5

10

15

20

25

30

35

particular species thereof. The method involves the steps of obtaining a sample suspected of containing filamentous fungi. The sample may be taken from an individual, such as blood, saliva, lung lavage fluids, vaginal mucosa, tissues, etc., or taken from the environment. The filamentous fungal cells can then be lysed, and the DNA extracted and precipitated. The DNA is preferably amplified using universal primers derived from the internal transcribed spacer regions, 18S, 5.8S and 28S regions of the filamentous fungal rDNA. Examples of such universal primers are shown below as ITS1 (SEQ ID NO: 62), ITS3 (SEQ ID NO: 63), ITS4 (SEQ ID NO: 64). Detection of filamentous fungal DNA is achieved by hybridizing the amplified DNA with a species-specific probe that selectively hybridizes with the DNA. Detection of hybridization is indicative of the presence of the particular genus (for generic probes) or species (for species probes) of filamentous fungus.

Preferably, detection of nucleic acid (e.g. probes or primers) hybridization can be facilitated by the use of detectable moieties. For example, the species-specific or generic probes can be labeled with digoxigenin, and an all-fungus probe, such as described in SEQ ID NO:61, can be labeled with biotin and used in a streptavidin-coated microtiter plate assay. Other detectable moieties include radioactive labeling, enzyme labeling, and fluorescent labeling, for example.

The invention further contemplates a kit containing one or more species-specific probes, which can be used for the detection of particular filamentous fungal species and genera in a sample. Such a kit can also contain the appropriate reagents for hybridizing the probe to the sample and detecting bound probe. The invention may be further demonstrated by the following non-limiting examples.

Examples

In this example, PCR assay employing universal, fungus-specific primers and a simple, rapid EIA-based format for amplicon detection were used.

Extraction of Filamentous Fungal DNA

A mechanical disruption method was used to obtain DNA from filamentous fungal species and an enzymatic disruption method described previously (13) was used to obtain DNA from yeasts. Filamentous fungi were grown for 4 to 5 days on Sabouraud dextrose agar slants (BBL,

10

15

20

25

30

35

19.54

 α_{ij}

5)

4

division of Becton Dickinson, Cockeysville, MD) at 35°C. Two slants were then washed by vigorously pipeting 5 mls of 0.01 M potassium phosphate buffered saline (PBS) onto the surface of each slant and the washes were transferred to 500 ml Erlenmeyer flasks containing 250 ml of Sabouraud dextrose broth (BBL). Flasks were then incubated for 4 to 5 days on a rotary shaker (140 rpm) at ambient temperature. Growth was then harvested by vacuum filtration through a sterile Whatman #1 filter paper which had been placed into a sterile Buchner funnel attached to a 2 L sidearm flask. The resultant cellular mat was washed on the filtration apparatus three times with sterile distilled water, removed from the filter paper by gentle scraping with a rubber policeman, and placed into a sterile Petri plate which was then sealed with parafilm and frozen at -20°C until used.

Just prior to use, a portion of the frozen cellular mat, equal in size to a quarter, was removed and placed into a cold mortar (6" diameter). Liquid nitrogen was added to cover the mat which was then ground into a powder with a pestle. Additional liquid nitrogen was added as needed to keep the mat frozen during grinding.

DNA was then purified using proteinase K and RNase treatment, multiple phenol extractions, and ethanol precipitation by conventional means (26).

PCR amplification

The fungus-specific, universal primer pair ITS3 (5'-GCA TCG ATG AAG AAC GCA GC-3') (SEQ ID NO: 63) and ITS4 (5'-TCC TCC GCT TAT TGA TAT GC-3') (SEQ ID NO: 64) was used to amplify a portion of the 5.8S rDNA region, the entire ITS2 region, and a portion of the 28S rDNA region for each species as previously described (13, 34). DNA sequencing used this primer pair and also the fungus-specific, universal primer pair ITS1 (5'-TCC GTA GGT GAA CCT GCG G-3') (SEQ ID NO: 62) and ITS4 to amplify a portion of the 18S rDNA region, the entire ITS1 and ITS2 regions, and a portion of the 28S rDNA region.

A DNA reagent kit (TaKaRa Biomedicals, Shiga, Japan) was used for PCR amplification of genomic DNA. PCR was performed using 2 μ l of test sample in a total PCR reaction volume of 100 μ l consisting of 10 μ l of 10X Ex Taq buffer, 2.5 mM each of dATP, dGTP, dCTP, and dTTP, in 8 μ l, 0.2 μ M of each primer, and 0.5 U of TaKaRa Ex Taq DNA polymerase.

5

10

Thirty cycles of amplification were performed in a Perkin-Elmer 9600 thermal cycler (Emeryville, CA) after initial denaturation of DNA at 95°C for 5 minutes. Each cycle consisted of a denaturation step at 95°C for 30 seconds, an annealing step at 58°C for 30 seconds, and an extension step at 72°C for 1 minute. A final extension at 72°C for 5 minutes followed the last cycle. After amplification, samples were stored at -20°C until used.

Table 1

DNA sequencing

Primary DNA amplifications were conducted as described above. The aqueous phase of the primary PCR reaction was purified using QIAquick Spin Columns (Quiagen, Chatsworth, CA). DNA was eluted from each column with 50 μ l of heat-sterilized Tris-EDTA buffer (10 mM Tris, 1 mM EDTA, pH 8.0).

Purified DNA was labeled using a dye terminator cycle sequencing kit (ABI PRISM, Perkin Elmer, Foster City, CA). One mix was made for each of the primers so that sequencing could be performed in both the forward and reverse directions. The reaction volume (20 μ l) contained 9.5 μ l Terminator Premix, 2 μ l (1 ng) DNA template, 1 μ l primer (3.2 pmol) and 7.5 μ l heat-sterilized distilled H₂O. The mixture was then placed into a pre-heated (96°C) Perkin Elmer 9600 thermal cycler for 25 cycles of 96°C

for 10 seconds, 50°C for 5 seconds, 60°C for 4 minutes. The PCR product was then purified before sequencing using CentriSep spin columns (Princeton Separations, Adelphia, NJ). DNA was then vacuum dried, resuspended in 6 µl of formamide-EDTA (5 µl deionized formamide plus 1 µl 50 mM EDTA, pH 8.0), and denatured for 2 min at 90°C prior to sequencing using an automated capillary DNA sequencer (ABI Systems, Model 373, Bethesda, MD).

The sequencing results were as follows:

Contamination precautions

Precautions were taken to avoid possible contamination of PCR samples by following the guidelines of Fujita and Kwok (13, 22). All buffers and distilled water used for PCR assays were autoclaved and fresh PCR reagents were aliquoted prior to use. Physical separation of laboratory areas used to prepare PCR assays and to analyze PCR products, and the use of aerosol-resistant pipette tips, reduced possible cross-contamination of samples by aerosols. Appropriate negative controls were included in each test run, including controls omitting either the primer or the DNA template during PCR assays.

15

10

Agarose gel electrophoresis

20

Gel electrophoresis was conducted in TBE buffer (0.1 M Tris, 0.09 M boric acid, 1 mM EDTA, pH 8.4) at 80 V for 1 to 2 hours using gels composed of 1% (w/vol) agarose (International Technologies, New Haven, CT) and 1% (w/vol) NuSieve agar (FMC Bioproducts, Rockland, ME). Gels were stained with 0.5 μ g of ethidium bromide (EtBr) per ml of distilled H₂O for 10 minutes followed by three serial washes for 10 minutes each with distilled H₂O.

25

Microtitration plate enzyme immunoassay for the detection of PCR products

30

Amplicons were detected using species-specific and genus probes labeled with digoxigenin and all-filamentous fungal probe labeled with biotin in a streptavidin-coated microtiter plate format (13, 34). Ten µl of PCR product was added to each 1.5 ml Eppendorf tube. Single-stranded DNA was then prepared by heating the tubes at 95°C for 5 minutes and cooling immediately on ice. Two-tenths of a ml of hybridization solution [4x SSC (saline sodium citrate buffer, 0.6 M NaCl, 0.06 M trisodium citrate, pH 7.0) containing 20 mM Hepes, 2 mM EDTA, and 0.15% (vol/vol) Tween 20] supplemented with 50 ng/ml each of the all-Aspergillus biotinylated probe and a species-specific digoxigenin-labeled probe was added to each

35

3NSDOCID: <WO___9850584A2_I_>

tube containing denatured PCR product. Tubes were mixed by inversion and placed in a water bath at 37°C to allow probes to anneal to PCR product DNA. After 1 hour, 100 µl of each sample was added to duplicate wells of a commercially prepared streptavidin-coated microtitration plate (Boehringer Mannheim, Indianapolis, IN). The plate was incubated at ambient temperature for 1 hour with shaking, using a microtitration plate shaker (manufactured for Dynatech by CLTI, Middletown, NY). Plates were washed 6 times with 0.01 M potassium phosphate buffered saline, pH 7.2, containing 0.05% Tween 20 (PBST). Each well then received 100 µl of horseradish peroxidase-conjugated, anti-digoxigenin Fab fragment (Boehringer Mannheim) diluted 1:1000 in hybridization buffer. incubation at ambient temperature for 30 minutes with shaking, the plate was washed 6 times with PBST. One hundred µl of a mixture of one volume of 3, 3', 5, 5'-tetramethyl benzidine peroxidase substrate (Kirkegaard and Perry Laboratories, Inc., Gaithersberg, MD) and one volume of peroxidase solution (Kirkegaard and Perry Laboratories) was added to each well and the plate was placed at ambient temperature for 10 minutes for color The A_{650nm} of each well was determined with a development. microtitration plate reader (UV Max, Molecular Devices, Inc., Menlo Park, CA). The absorbance value for the reagent blank, where DNA was absent but replaced with distilled H₂O, was subtracted from each test sample.

Statistical analysis

The Student's t test was used to determine differences between sample means. Means are expressed as the mean plus or minus the standard error from the mean. Differences were considered significant when P<0.05.

The following probes were used to detect and distinguish each species.

Species-specific probes to the ITS2 region of rDNA for Aspergillus fumigatus (SEQ ID NO:32), A. flavus (SEQ ID NO:31), A. niger (SEQ ID NO:33), A. terreus (SEQ ID NO:34), and A. nidulans (SEQ ID NO:35) correctly identified each of the respective species (P<0.001), and gave no false-positive reactions with Rhizopus, Mucor, Fusarium, Penicillium, or Candida species. The A. flavus probe also recognized A. oryzae, which belongs to the A. flavus group. Identification time was reduced from a mean of 5 days by conventional methods to 8 hours.

Species-specific probes to the ITS2 region of rDNA for Fusarium oxysporum, F. solani, and F. moniliforme, correctly identified each of the respective species (P<0.001), and gave no false-positive reactions with Blastomyces, Apophysomyces, Candida, Aspergillus, Mucor, Penecillium, Rhizopus, Rhizomucor, Absidia, Cunninghamella, Pseudallescheria, Sporothrix, or Neosartorya. Empty boxes in Table 4 represent zero probe reactivity.

Species-specific probes to various other zygomyces are presented in Table 5, showing correct identification of each species and no false positives. The exceptions are that the *M. circinelloides* probe hybridized with the *M. rouxii* DNA and the *M. plumbeus* probe hybridized with the *M. racemosus* DNA. However, the *M. rouxii* probe did not hybridize with *M. circinelloides* DNA, nor did the *M. racemosus* probe hybridize with *M. plumbeus* DNA. Therefore, by a process of elimination, each species can be correctly identified. Empty boxes in Table 5 represent zero probe reactivity.

CLAIMS

We claim:

4

ä

Ŷ

*

- 1. An isolated nucleic acid probe for identifying a species selected from the group consisting of Aspergillus flavus (SEQ ID NO:1), Aspergillus fumigatus (SEQ ID NO:2), Aspergillus niger (SEQ ID NO:3), Aspergillus terreus (SEQ ID NO:4), Aspergillus nidulans (SEQ ID NO:5), Fusarium solani (SEQ ID NO:6), Fusarium moniliforme (SEQ ID NO:7), Mucor rouxii (SEQ ID NO:8), Mucor racemosus (SEQ ID NO:9), Mucor plumbeus (SEQ ID NO:10), Mucor indicus (SEQ ID NO:11), Mucor circinilloides f. circinelloides (SEQ ID NO:12), Rhizopus oryzae (SEQ ID NO:13 and NO:14), Rhizopus microsporus (SEQ ID NO:15 and 16), Rhizopus circinans (SEQ ID NO:17 and 18), Rhizopus stolonifer (SEQ ID NO: 19), Rhizomucor pusillus (SEQ ID NO:20), Absidia corymbifera (SEQ ID NO:21 and 22), Cunninghamella elegans (SEQ ID NO:23), Pseudallescheria boydii (teleomorph of Scedosporium apiospermum) (SEQ ID NO:24, 25, 26, and 27), Penicillium notatum (SEQ ID NO:28), or Sporothrix schenkii (SEQ ID NO:29) wherein the probe selectively hybridizes to a portion of the nucleic acid of SEQ ID NOS:1-29, or a complementary sequence thereof, respectively.
- 2. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with an *Aspergillus flavus* nucleic acid of SEQ ID NO:1, or a complementary sequence thereof.
- 3. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with an *Aspergillus fumigatus* nucleic acid of SEQ ID NO:2, or a complementary sequence thereof.
- 4. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with an *Aspergillus niger* nucleic acid of SEQ ID NO:3, or a complementary sequence thereof.

- 5. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with an Aspergillus terreus nucleic acid of SEQ ID NO:4, or a complementary sequence thereof.
- 6. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with an *Aspergillus nidulans* nucleic acid of SEQ ID NO:5, or a complementary sequence thereof.
- 7. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Fusarium solani* nucleic acid of SEQ ID NO:6, or a complementary sequence thereof.
- 8. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Fusarium moniliforme* of SEQ ID NO:7, or a complementary sequence thereof.
- 9. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Mucor rouxii* of SEQ ID NO:8, or a complementary sequence thereof.
- 10. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Mucor racemosus* of SEQ ID NO:9, or a complementary sequence thereof.
- 11. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Mucor plumbeus* of SEQ ID NO:10, or a complementary sequence thereof.
- 12. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Mucor indicus* of SEQ ID NO:11, or a complementary sequence thereof.
- 13. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Mucor circinilloides f. circinelloides* of SEQ ID NO:12, or a complementary sequence thereof.

*

 ${\bf x}_{i}$

- 14. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Rhizopus oryzae* of SEQ ID NO:13 and 14, or a complementary sequence thereof.
- 15. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Rhizopus microsporus* of SEQ ID NO:15 and 16, or a complementary sequence thereof.
- 16. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Rhizopus circinans* of SEQ ID NO:17 and 18, or a complementary sequence thereof.
- 17. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Rhizopus stolonifer* of SEQ ID NO:19, or a complementary sequence thereof.
- 18. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Rhizomucor pusillus* of SEQ ID NO:20, or a complementary sequence thereof.
- 19. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Absidia corymbifera* of SEQ ID NO:21 and 22, or a complementary sequence thereof.
- 20. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Cunninghamella elegans* of SEQ ID NO:23, or a complementary sequence thereof.
- 21. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Pseudallescheria boydii* (teleomorph of *Scedosporium apiospermum*) of SEQ ID NO:24, 25, 26 and 27, or a complementary sequence thereof.

ĮΦį

1.5

....

- 22. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Penicillium notatum* of SEQ ID NO:28, or a complementary sequence thereof.
- 23. The isolated nucleic acid probe of Claim 1 capable of selectively hybridizing with a *Sporothrix schenkii* of SEQ ID NO:29, or a complementary sequence thereof.
- A method of detecting a species selected from the 24. group consisting of Aspergillus flavus (SEQ ID NO:1), Aspergillus fumigatus (SEQ ID NO:2), Aspergillus niger (SEQ ID NO:3), Aspergillus terreus (SEQ ID NO:4), Aspergillus nidulans (SEQ ID NO:5), Fusarium solani (SEQ ID NO:6), Fusarium moniliforme (SEQ ID NO:7), Mucor rouxii (SEQ ID NO:8), Mucor racemosus (SEQ ID NO:9), Mucor plumbeus (SEQ ID NO:10), Mucor indicus (SEQ ID NO:11), Mucor circinilloides f. circinelloides (SEQ ID NO:12), Rhizopus oryzae (SEQ ID NO:13 and NO:14), Rhizopus microsporus (SEQ ID NO:15 and 16), Rhizopus circinans (SEQ ID NO:17 and 18), Rhizopus stolonifer (SEQ ID NO: 19), Rhizomucor pusillus (SEQ ID NO:20), Absidia corymbifera (SEQ ID NO:21 and 22), Cunninghamella elegans (SEQ ID NO:23), Pseudallescheria boydii (teleomorph of Scedosporium apiospermum) (SEQ ID NO:24, 25, 26, and 27), Penicillium notatum (SEQ ID NO:28), or Sporothrix schenkii (SEQ ID NG:29) in a sample comprising combining the sample with a nucleic acid probe capable of selectively hybridizing with a nucleic acid of SEQ ID NO:1-29, or a complementary sequence thereof, respectively, the presence of hybridization indicating the detection of the species in the sample.
- 25. The method of Claim 24, wherein the probe is capable of selectively hybridizing with an *Aspergillus flavus* nucleic acid of SEQ ID NO:1, or a complementary sequence thereof.
- 26. The method of Claim 24, wherein the probe is capable of selectively hybridizing with an *Aspergillus fumigatus* nucleic acid of SEQ ID NO:2, or a complementary sequence thereof.

(54) Title: NUCLEIC ACIDS FOR DETECTING ASPERGILLUS SPECIES AND OTHER FILAMENTOUS FUNGI

(57) Abstract

Nucleic acids for detecting Aspergillus species and other filamentous fungi are provided. Unique internal transcribed spacer 2 coding regions permit the development of nucleic acid probes specific for five different species of Aspergillus, three species of Fusarium, four species of Mucor, two species of Penecillium, five species of Rhizopus, one species of Rhizomucor, as well as probes for Absidia corymbifera, Cunninghamella elagans, Pseudallescheria boydii, and Sporothrix schenkii. The invention thereby provides methods for the species-specific detection and diagnosis of infection by Aspergillus, Fusarium, Mucor, Penecillium, Rhizopus, Rhizomucor, Absidia, Cunninghamella. Pseudallescheria or Sporthrix in a subject. Furthermore, genus-specific probes are also provided for Aspergillus, Fusarium and Mucor, in addition to an all-fungus nucleic acid probe.

INTERNATIONAL SEARCH REPORT

ational application No.

PCT/US 98/08926

Box i	Observations where certain claims were found unsearchable (Continuation of Item 1 of I				
This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:					
1. 🔲	Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:				
2.	Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:				
з. 🗌	Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).				
Box II	Observations where unity of invention is lacking (Continuation of item 2 of first sheet)				
This Inte	mational Searching Authority found multiple inventions in this international application, as follows:				
sed	e FURTHER INFORMATION sheet				
1.	As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.				
2. 🗌	As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.				
з	As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:				
	No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.: 2-6,25-29,48,50 (complete); 1,24,47,49 (partial)				
Remark	on Protest The additional search fees were accompanied by the applicant's protest. No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. Claims: 2-6,25-29,48,50 (complete); 1,24,47,49 (partial)

Nucleic acid sequences (Seq ID.: 1-5,58,61) specific for Aspergillus spp. and methods using them

2. Claims: 7,8,30,31 (complete); 1,24,47,49 (partial)

Nucleic acid sequences (Seq ID.: 6,7) specific for Fusarium spp. and methods using them

3. Claims: 9-13,32-36 (complete); 1,24,47,49 (partial)

Nucleic acid sequences (Seq ID.: 8-12) specific for Mucor spp. and methods using them

4. Claims: 14-17,37-40 (complete); 1,24 (partial)

Nucleic acid sequences (Seq ID.: 15-19) specific for Rhizopus spp. and methods using them

5. Claims: 18,41 (complete); 1,24 (partial)

Nucleic acid sequence (Seq ID.: 20) specific for Rhizomucor pusillus and methods using it

6. Claims: 19,42 (complete); 1,24 (partial)

Nucleic acid sequences (Seq ID.: 21,22) specific for Absidia corymbifera and methods using them

7. Claims: 20,43 (complete), 1,24 (partial)

Nucleic acid sequence (Seq ID.: 23) specific for Cunninghamella elegans and methods using it

8. Claims: 21,44 (complete); 1,24 (partial)

Nucleic acid sequences (Seq ID.: 24-27) specific for Pseudallescheria boydii and methods using them

9. Claims: 22,45 (complete); 1,24 (partial)

Nucleic acid sequence (Seq ID.: 28) specific for Penicillium notatum and methods using it
